

RYAN KELLY

Software Developer

Technologies

Overview

I have some open source projects under the organisation **Resultful** their aim is to enable exceptionless programming using a functional programming style. I have done several talks to a local developer group advocating F#, its tools and functional programming in general. But coming from the Perspective of a C# developer

Experience

- .NET
- Typescript
- MySQL/ SQL Server
- C# / F#
- CI / CD
- Terraform/ Pulumi

Personal Profile

I have always had a keen interest in all things technology related. Developing software is not just a career for me, I strive to advance my skills both inside and outside of work. Utilising agile software practices alongside working within a collaborative team is something I believe is key to building great software. I am motivated by technical challenges and won't stop until the solution is complete. I am now looking for a new challenge within an environment where I can have creative control as well as the support I need to develop and progress in my career.

Employment History

May 2019 - Present	Software Developer (Senior/Principal) My main responsibility at Sentric Music was to build a system to process royalties, this system had to scale to billions of records. As part of this I had to learn a significant amount about the Data Engineering space, pushing for Iceberg Adoption, learned Python during this period as well. As part of my role as Principal, I had to think about the long term technology strategy of how we migrate our application stack off the .NET Framework. Took a two tier approach, working on slow harmonising and extracting common components into a supported version. Then work with our front-end engineer to initiate a design system using Storybook to build scalable solution for efficiently porting pages to a REST API + React site from a MVC 5 application. The AI Code Agent development recently was something everyone had to adapt to, I spent the time looking through the tooling requirements and how to adopt it seamlessly in our environment. Finding the ways not just to embrace it but to actively make our experience with software engineering better. I like to think better engineering outcomes leads to better Agentic engineering outcomes. In regards to the technology stack. I introduced the Elastic stack for Observability via Serilog, this allowed monitoring of a massive number of items being processed. Pushed for OTEL to continue evolving our approach. Adopted Pulumi as our IAC provider for AWS Resource management. Moved all repositories from Bitbucket(Mercurial) to GitHub. Revamped our CI/CD pipeline continually, Jenkins to Github Actions.	Sentric Music
Nov 2017 - May 2019	Software Developer (Professional/ Senior) Building Lender Integrations. This had to be a scalable, observable cloud based solutions on AWS using maintaining and evolving a large codebase.	Zuto
July 2014 - Nov 2017	Software developer (Placement/ Graduate) I built software that automated food packaging lines, deployed to factories all around the world. Built a number of core features especially around our Date Printing engine.	AutoCoding Systems Ltd

Education

2012 -2016 University	Computer Science with a Year in Industry First Class with Honours My final year project involved creating a 3D maze generation tool which is available on GitHub, Called ProceduralGeneration3DMazes. The dissertation focused on the properties of the generated mazes and I performed a statistical analysis on many different configurations and their results. Leveraging technologies and practices from my placement (C#, SOLID and TDD) to build a system in Unity 3D.	University of Liverpool
2010 - 2012 College	A-Levels Computing A , Chemistry A , Maths B	Carmel College
